GvG Tactical Network (Tacnet)

tacnet.regfy.fun:2053

Tacnet is a guild coordination tool for GvG battles in Where Winds Meet. Instead of using voice or typing in Discord, players report the situation with a button click. The commander sees the full picture in real time and issues orders to squads.

This document describes the interface as it looks in the current version. The Player, Team Leader, and Commander sections are for regular guild members. The Admin and Developer sections are for whoever sets up the roster and accounts before a battle.

1. Roles and access

Each account has one role. The role determines which pages are available in the sidebar and what you can do.

Role	Sidebar pages	What it does
Player	Player	Sees their team's order, can send a help signal
Team Leader	Player, Team Leader	Reports enemies and team status, sees orders
Commander	Player, Dashboard, Replay	Sees the guild-wide feed, issues orders to squads, can start/end the battle
Admin	All pages	Manages roster, assigns roles to existing accounts, Discord integration, starts/ends the battle

Every role also always has access to **Home** (see section 4) - it isn't listed above because the sidebar shows it to everyone regardless of role.

Teams T1-T6, each explicitly assigned a side - Defense / Attack / Flex. The admin sets the side manually. Players can also be moved to Reserves, a separate list outside the T1-T6 structure (see section 9.5).

2. Logging in

Open the login page.

- **Enter the Username and Password given by the admin and click Log in.**
- **Or click Login with Discord** if your Discord is already linked to your account - this replaces entering a password.

If there are 5 failed login attempts from one IP within 30 seconds, the system temporarily blocks further attempts (protection against password guessing). Just wait a bit.

After logging in you land on **Home** - your dashboard for whichever account you're signed in as.

3. Navigation

Every signed-in page shows a sidebar on the left with:

- The pages available to your role (see the table in section 1)
- A Menu link that always returns you to Home, regardless of role
- Your initials, username and role at the bottom, with a Log out button next to them

4. Home

Home is the starting screen after login and the page the Menu link always returns you to. It shows:

- **Stat cards** - Battle (Active/Inactive, and since when), Teams, players In roster, and Reserves count.
- **Active roster** - a read-only view of every team: side, label, tags, and its members with role badge, bulwark symbol and an online/offline presence dot.
- **Reserves** - the same read-only member list for whoever is currently in Reserves.
- **Account** - Link Discord account (or Re-link Discord account once it's linked, see section 9.6 for what that unlocks), and Change password

If the site fails to connect and shows a handshake error, it's usually a stale session token. Fix: refresh the page, log out, then log back in.

5. Player panel

The main screen for a regular squad member during a battle.

What's on screen

- **Current order** - the order issued to your team. Empty until the commander issues an order to your team; once issued, the banner changes color by order type (attack - orange, defense - green, critical - dark red, and so on).
- **The feed below the banner** - the latest events for your team: spotted enemies, team status reported by your leader. Keeps the last 8 entries.
- **The NEED HELP button** - the panic button. The alert goes to your team and the commander

HELP and other actions are rate-limited: no more than 5 actions per 3 seconds from one connection

If a battle is running, a jungle-camp or boss spawn reminder can briefly appear as a banner at the top of the screen a few minutes before the camp or boss spawns (see section 11 for how the timing works).

6. Team Leader panel

Available to the Leader and Admin. The team leader is the one who reports the situation for the whole team, while everyone else only sees the Player panel

Enemy - reporting enemies

Four buttons for specific enemy types: ENEMY TB, ENEMY HEALER, ENEMY TANK, ENEMY NAMELESS. A click immediately sends the report to your team and the commander

Team status

Button	When to press it
TEAM WIPED	The team has been completely wiped
REGROUP	The team is regrouping
NEED HELP	Need assistance / reinforcements
RETREATING	The team is retreating

Button	When to press it
AUTONOMOUS	The team is acting on its own, no special status to report

The **Current status** banner above the buttons always shows your team's own last-reported status, and automatically reverts to AUTONOMOUS 25 seconds after you set anything else

Incoming orders

The same current-order banner as on the Player panel, plus a feed of events for the team. Spawn reminders (jungle/boss) appear here too

At the bottom of the screen there's a technical Log line - it shows literally every event in the guild in raw form, for debugging. You can ignore it during a battle

7. Commander panel (Dashboard)

Available to the Commander and Admin. The main screen for whoever sees the whole battle and issues orders.

Battle status

At the top of the screen - a No active battle / Battle in progress since HH:MM indicator, plus Start Battle and End Battle buttons right here on the dashboard

Order macros

A macro bundles an order type with one or more target teams (or "All teams") under a short name, so you can fire off a combination you use often with a single click:

- Select the target team(s) below (or check "All teams"), pick an order type from the dropdown, give the macro a name, and click Save as macro.
- Click a saved macro's button to run it immediately.
- Click the X on a macro to delete it

Macros are shared - saved on the server and visible to anyone opening the Dashboard

Roster and targeting

Team cards for T1-T6: side (Defense/Attack/Flex), squad label, tags, the list of players with their role (DPS/TANK/HEALER), online status, and, if set, a bulwark symbol (⚔️↑ top, ⚔️ center, ⚔️↓ bottom). A card shows a warning if the squad has no Tank or no Healer assigned yet

You can target more than one team at once:

- Click a team - either its card in the roster, or its chip with the team number in the Issue order block - to add or remove it from the current selection
- Select all / Clear next to the target line select or deselect every team in one click.
- Click the order button you need. It goes to every selected team, their leaders, and everyone watching Dashboard/Player

Available orders:

Category	Orders
Attack	PUSH BOT, PUSH MID, PUSH TOP, ATTACK GOOSE
Key attack	KILL BOSS, BOMB
Defense	DEFEND BOT, DEFEND MID, DEFEND TOP, DEFEND GOOSE, DEFEND TREE

Category	Orders
Other	HOLD, PROTECT HEALER, ROTATE, FALL BACK, BOT JUNGLE, TOP JUNGLE

Reserves

If anyone is currently in Reserves, a read-only Reserves card appears below the roster, showing the same member details as a team card. Reserves can't be selected as an order target - move a player into a team first (section 9.5).

Live feed

Below the roster there's a guild-wide feed of all events.

8. Replay - battle archive

Available to the Commander and Admin roles. On the left - the list of saved battles, on the right - the full event feed of the selected battle, in the same format as the Dashboard live feed. Files appear here after End Battle or Save log now in the admin panel

9. Admin panel

Available to the Admin. This is where the roster is set up before a battle.

9.1 Player pool

- In the **Add members to the pool** field, paste nicknames - separated by commas or new lines. Duplicates are ignored.
- Click **Add to pool**. Nicknames appear below, in **Free players** (Unassigned).

9.2 Registered accounts not yet in the pool

An expandable block for accounts that already exist (e.g. someone who self-registered via Discord) but haven't been added to the pool yet

9.3 Manage roles

An expandable block to change the role of an already-registered Player / Leader / Commander account, with bulk selection

This only works on accounts that already exist. Admin and Developer accounts don't show up here and can't be changed from this screen. If a nickname in the pool isn't a registered account yet, the L and P buttons below (9.4) will tell you to have that player log in via Discord first, or to ask a Developer to create the account - a plain Admin can no longer create brand-new accounts.

9.4 Teams

For each of T1-T6 you set:

- Side - Defense / Attack / Flex
- Label - free text for the Discord post, e.g. "J3 + B"
- Tags - Top jungle (own), Bottom jungle (own), Top jungle (enemy), Bottom jungle (enemy), and Boss. These decide which squad gets a targeted spawn reminder (see section 11)

To add a player to a team, pick the team from the dropdown next to their nickname in the pool. For each player in a team, you can set:

- Role: DPS / TANK / HEALER.
- Bulwark position: none / top / center / bottom.

Next to each name in a team there are three actions:

- **L** - make them team leader. Opens an account-creation prompt with the Leader role
- **P** - create or point a regular player account for this nickname
- **Reserve** - move the player out of the team and into Reserves.
- **X** on the chip - remove the player from the team back into the pool.

Role and bulwark, once set, are remembered per nickname (member presets) and are auto-filled the next time that player is added to a team

9.5 Reserves

Reserves is now its own list, separate from the T1-T6 teams. Players moved here are pulled out of their squad entirely. They show up as their own list for the Commander too, and can't be targeted by combat orders. Move a reserve back into a team using the dropdown next to their name, the same way you assign anyone from the pool

After making changes click **Save roster** - the changes propagate to all connected clients instantly. **Save log now** saves a snapshot of the current battle history to a file without clearing it

9.6 Battle

- **Start Battle** - marks the battle as active, everyone sees a timer
- **End Battle** - archives the whole history to a file and resets the feed for everyone.

Both are also available directly on the Commander's Dashboard (section 7)

9.7 Configuration (Discord & messaging)

Discord webhooks, custom emoji, and message sending used to sit directly on the page - they live behind a single Configuration button:

Discord channels (webhooks)

To send messages to a guild Discord channel from Tacnet, you need that channel's webhook:

- **In Discord:** Edit Channel => Integrations => Webhooks => New Webhook => Copy URL
- **In the modal:** type the channel name and paste the webhook URL, then click Add channel

You can add several channels and pick the one you need when sending a message

Emoji for roles and tags

Roles (DPS/Tank/Healer) and tags (the four jungle tags, Boss, and Reserves) can use custom server emoji instead of the defaults. In Discord, type `\:emoji_name:` and send the message - it turns into a code like `<:tank:123456789012345678>`. Paste that code into the matching field. An empty field falls back to the default emoji. Bulwark symbols are fixed and can't be customized

Sending a Discord message

Two options:

- **Free-form message** - pick a channel, toggle whole squads to ping and/or specific people, write the text, click Send custom message
- **Team composition (auto-post)** - Preview text shows how the post with the selected squads' composition will look. Send team composition sends it to the channel and really pings everyone in the selected squads

Whoever has Discord linked to their account (section 4) gets a real @mention. Everyone else gets plain-text @nickname

10. FAQ

Forgot my password

You can't reset your own password - only an Admin or Developer can.

Why can't I create an account for a new nickname?

Only a Developer can create a brand-new account from the Admin panel. As a plain Admin, if a nickname in the pool isn't registered yet, have that player log in once via Discord (which registers them), or ask a Developer to create the account directly

Why can't I see an order/report from another squad

Player and Team Leader only see events for their own squad. Commander, Admin, Developer and anyone watching Replay see the guild-wide picture

Jungle/boss spawn reminders

While a battle is active, the server automatically sends a spawn-reminder banner: for jungle camps at 5, 10, 15, 20, 25 and 30 minutes into the battle, and for the boss at 5 and 15 minutes in. If a squad has one of the specific jungle tags set in the Admin panel (section 9.4), only that squad plus the Commander and Admin get a reminder naming that camp; if no squad has a specific tag set, everyone gets a generic jungle reminder instead. The banner text currently displays in Russian regardless of the site's interface language, I'll fix it later

Can Reserves get orders?

No. Reserves are outside the T1-T6 squad structure and can't be selected as an order target on the Dashboard. Move the player into a squad first (section 9.4/9.5) if they need to receive orders.

Connection drops / "reconnecting..."

SignalR reconnects automatically; the status in the corner of the screen switches to connected once the connection is restored. The current order and recent events are pulled again automatically, nothing needs to be refreshed manually.

Battle data disappeared after a server restart

That's intentional, the live battle feed is kept in server memory and doesn't survive a restart. The roster, accounts, order macros, and archives of finished battles are all persistent. If a battle is in progress, save it via Save log now before a planned restart
