

User Guide

Tacnet Overlay

Tacnet Overlay is a small Electron app that shows your Tacnet pages (Player / Team Leader / Dashboard) in a transparent, always-on-top window over the game, so you don't have to alt-tab to see orders or report something

This document describes the desktop overlay app. It doesn't cover the Tacnet website itself - see the separate Tacnet User Guide for that

1. Installing

Download and run the installer (an unsigned .exe for Windows)

Because the build isn't code-signed, Windows SmartScreen will show a warning the first time you run it - click "More info" -> "Run anyway". This is expected for unsigned .exe files

On first launch you'll see a short one-time onboarding popup summarizing the controls below

2. How it works

On startup the overlay opens the Tacnet Home page inside its own transparent window, on top of everything else, including the game. From there you navigate to whatever page you need (Player / Team Leader / Dashboard) using the normal links inside the site, exactly like in a browser

No setup is needed on the Tacnet side - the overlay logic (the drag bar, the transparency, click-through) is injected automatically by the Electron app whenever a page loads. You sign in with the same account you'd use on the website

3. Controls

Action	Hotkey	What happens
Toggle click-through	Alt+O	Switches between clicks passing into the game (click-through) and the overlay catching clicks (interactive), so you can press its buttons
Toggle opaque / transparent	Alt+P	Makes the whole overlay nearly opaque so you can read it clearly. Press again to go back to transparent - it stays as you left it, it doesn't revert on its own
Show / hide the overlay	Alt+H	Hides or re-shows the whole overlay window
Reset window position, show/hide, quit	Right-click tray icon	Opens the tray menu with all of the above plus Reset window position and Quit

By default, the overlay is in click-through mode, so clicks pass straight through the window into the game. Switching modes is manual only, via Alt+O - there's no automatic switching on hover, since that used to fight with the manual hotkey

4. How to tell what's going on when everything is transparent

- **The dotted bar at the top** (::: TACNET OVERLAY :::) is what you drag the window by. It flashes briefly (green or yellow) whenever you switch click-through/interactive mode, so you'll notice it out of the corner of your eye without having to watch the indicator directly.
- **The text label in the corner** (click-through / interactive) always shows the current mode (however when change pages it'll show click-through but still would be interactive)
- **Alt+P** makes the whole overlay nearly opaque so you can read it clearly - your team's status, the current order, everything. Press **Alt+P** again when you're done to go back to transparent.

5. If the window gets lost off the edge of the screen

Right-click the tray icon and choose Reset window position - this puts the overlay back at its default spot (top-right of your primary screen).

6. Staying signed in

The overlay uses its own named browser session, separate from any regular browser you use. It saves both your Tacnet session and your Discord cookies to disk, so once the backend issues you a long-lived session token, you won't need to log in - or log into Discord again - every time you restart the overlay

7. Overlay styling

The overlay automatically darkens and blurs the background of the site's cards and panels so text stays readable against a transparent window

If a new block on some page still shows up fully opaque or fully invisible after a Tacnet update, that's a known gap between the two projects rather than something you can fix from here - just report it
